

Lab: Introduction to Unit Testing (C#)

Tasks to do

1. Create C# project of the type “Class Library” containing the class `BankAccount`.
2. On the base of the document “Creating & Running Unit Tests vs2022.pdf” perform unit testing of the method `Debit()` of the class `BankAccount`.

Note: As we discuss in the lab on unit testing in Java, to perform unit testing of the method, we need to check all possible inputs of the method under test: both correct and exceptional ones (for example, check the method on an instance of `BankAccount` which does not contain enough information for the operation).
